HOW TO CHOOSE CASTER

Using casters can reduce the work force and increase the work efficiency. The right caster should be chosen by the manner of application, condition and request (for example facility, labour-saving, durability). The factor must be considered as follows.

THE LOAD CAPACITY

$$(1) \text{ Load: } T = \frac{E+Z}{M}$$

T=each caster load E=the weight of the vehicle
Z=the weight of moving object M=efficient load casters quantity
(the position and different heavy distribution must be considered)

(2)Efficient load caster quantity as follows

(3)The casters load a the position of maximum should be considered when choose load capacity. Concrete load position and maximum position(P2) as follows.

FLEXIBILITY

- (1)The casters should be flexible, easily used and durable. The materials with low friction coefficient or assembled parts after specified processing should be chosen as its rotating parts (such as its leg frame and wheels).
- (2)The bigger eccentric distance of the leg frame, the more flexible it rotates, with a much lower loading capacity accordingly.
- (3)The bigger wheel diameter, the less energy cost it will be, and it's better for ground protection. The bigger wheel runs slower than the smaller one, so it is not easy to have thermal deformation and is more durable. So the wheels with bigger diameter are recommended on the condition that height requirement is available during fitting.

MOVING SPEED

The requests of caster speed: at the normal temperature and on the smooth floor, the speed should be lower than 4km/h of walk and there must be a static interval during the work time.

USAGE ENVIRONMENT

Before choosing the casters, you should consider the ground material, barrier, residue and special environment (eg. Scrap iron, high or low temperature, strong acidity and basicity, grease, chemical solvent and ESD environment). Special processed casters should be chosen if they are used in special environment.

如何选择合适的脚轮

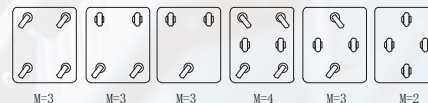

使用脚轮是为了减轻劳动强度，提高工作效率。根据应用方式、条件和要求（方便、省力、耐用）正确选择适合您使用的脚轮。请考虑以下几点：

承载重量

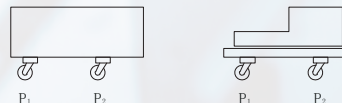

$$(1) \text{ 承载重量计算 } T = \frac{E+Z}{M}$$

T=每只脚轮承载的重量 E=运输工具的重量
Z=移动物体的重量 M=轮子的有效承载数量（应考虑位置、重量分布不均的因素）

(2)轮子有效承载数量（M）如下图：

(3)选择承重时要按照最大支撑点处脚轮的承载量计算。脚轮具体受力支撑点如下图，P2为最重支撑点。

灵活性

- (1)脚轮应灵活、轻松并耐用，其转动部位（脚架转动，轮子滚动）应选用摩擦系数小的材料或经特殊工艺处理后组装的配件（如滚珠轴承或淬火处理）。
- (2)脚轮的偏心距越大转向越灵活，但承载能力相应降低。
- (3)轮子的直径越大推动越省力，并能更好地保护地面。轮子大比小转动缓慢，不易发热变形，更耐用。在安装高度允许的条件下，尽可能选择大直径的轮子。

移动速度

脚轮速度的要求：在常温环境下，在平坦的地面上，不高于步行速度4KM/H，并由一定间歇的工作状态。

使用环境

选择时应考虑地面材料、障碍物、残留物或特殊环境（如铁屑、高温、低温、酸性大、碱性大、油液和化学溶剂以及要求抗静电的场所），在特殊环境中使用的应选择用特殊材料制成的脚轮。
